Course Objectives: The Mini Project course is designed to enable students to apply the theoretical knowledge and technical skills acquired from previous courses as well as relevant to field to identify and implement solutions for real-world problems. The course aims to apply fundamentals of project management, emphasizing planning, execution, time management, and cause-effect analysis among various project dimensions. It encourages innovation and creativity by allowing projects that go beyond the standard curriculum, thereby promoting learning of additional tools, technologies, and design methodologies along with team collaboration, leadership, and interpersonal skills through group-based project execution. Working on real world applications also imbibes a sense of social responsibility. The solutions of problem statements aligned with domains such as Agriculture, Healthcare, Automation & Artificial Intelligence, Embedded systems, Energy and Environment etc are encouraged.

Course Outcomes (CO):

Upon successful completion of the Mini Project course, students will be able to:

- CO1.** Identify and define a relevant engineering problem, clearly stating its objectives and scope.
- CO2.** Analyze system requirements and design appropriate components or modules to meet the desired specifications.
- CO3.** Implement, test, and validate the proposed solution using suitable tools, technologies, and methodologies.
- CO4.** Collaborate effectively within a team, adhering to timelines, demonstrating responsibility, and applying principles of behavioural science.
- CO5.** Communicate project ideas, processes, and outcomes effectively through written reports and oral presentations, while adhering to ethical and professional standards.

Evaluation of CA:

- The mini project will be evaluated on continuous basis and will be graded accordingly.
- CA Evaluations schedule, evaluation scheme and detailed rubrics will be declared at the starting of the semester by the concerned faculty in-charge.
